

AI Agent Factory Assignment

Real-World Example: Daily Attendance Monitoring AI Agent

Assignment Focus: Understand the Ecomm Mart example and apply the same concepts to a real-world daily life or workplace scenario.

1. Review of Identified Use Cases

The following use cases are relevant because they are routine manager-level tasks and can be converted into Digital FTE ideas using the same structure shown in the Ecomm Mart support worker example.

Use Case	Fit for AI Agent?	Suggestion
Leave Request Approval Agent	Very good	Good for HR workflow. The agent can check leave balance, policy, team capacity, and recommend approval or rejection.
Daily Attendance Monitoring Agent	Excellent	Best option for this assignment because it is a daily, measurable, repetitive task with clear rules and actions.
CV Shortlisting Agent	Good, but sensitive	Useful for screening many resumes, but it needs strong human review, privacy controls, and anti-bias guardrails.

2. Recommended Use Case for the Assignment

Recommended choice: Daily Attendance Monitoring AI Agent

This use case is the strongest choice because it is easy to map with the Ecomm Mart example:

- It is a daily routine task.
- It uses company records such as attendance, leave, HR, and employee data.
- It needs clear business rules such as office time, grace time, leave status, and escalation rules.
- It can produce measurable outcomes such as time saved, fewer missed attendance issues, and faster reporting.
- It still keeps humans in control for warnings, penalties, exceptions, and final decisions.

3. Assignment Write-Up

Real-World Problem

As a manager, I need to check the daily attendance of each employee. This includes checking who is present, absent, late, on approved leave, or missing check-in/check-out records. Doing this manually every day takes time and can lead to missed issues.

To solve this, I want to create an AI Attendance Monitoring Agent that checks attendance daily and takes actions according to company rules.

Step 1: Write Clear Instructions

The AI agent should have clear instructions. Its goal is to:

- Check daily attendance of all employees.
- Identify absent employees.
- Identify late arrivals.
- Identify missing check-in or check-out records.
- Check whether the employee is on approved leave.
- Send reminders or alerts where required.
- Escalate repeated attendance issues to the manager.

Example instruction: Every day at 10:30 AM, check employee attendance records. If an employee has not checked in and has no approved leave, mark them as absent and notify the manager. If an employee is late more than 3 times in a week, escalate the case to HR and the manager.

Step 2: Connect to Company Records

The AI agent needs access to trusted company systems. These systems become the source of truth for attendance decisions.

- HRMS system
- Attendance system
- Employee database
- Leave management system
- Company attendance policy
- Manager and department records
- Email, Slack, or Microsoft Teams for notifications

This is similar to the Ecomm Mart example where the support worker connects to Shopify orders, customer database, and ticket system. For the attendance agent, company attendance and HR records are the source of truth.

Step 3: Give It Skills

The AI agent needs specific skills to do the job properly. It should know how to:

- Read attendance records.
- Compare check-in time with official office time.

- Check approved leave before marking someone absent.
- Classify attendance status as Present, Late, Absent, Half Day, Leave, or Missing Punch.
- Detect repeated patterns, such as frequent lateness.
- Write professional notification messages.
- Prepare a daily attendance summary for the manager.

Example rule: If office time is 9:00 AM and grace time is 15 minutes, the agent should mark employees as late after 9:15 AM unless there is an approved exception.

Step 4: Set the Guardrails

The AI agent should not have unlimited authority. Important guardrails include:

- The AI cannot terminate, penalize, or deduct salary automatically.
- The AI cannot approve exceptions without manager or HR approval.
- The AI must check approved leave before marking someone absent.
- The AI must keep an audit trail of every action.
- The AI must not share employee attendance details with unauthorized people.
- The AI should escalate unclear cases to the manager.
- The AI must follow company attendance policy only.

Example guardrail: If an employee is absent but has an approved leave request, the AI should not send a warning. It should mark the employee as On Approved Leave.

Step 5: Test, Then Deploy

Before using the agent in real operations, the company should test it carefully.

- Run the AI agent on 30 days of old attendance data.
- Compare AI results with HR manual records.
- Check whether it correctly identifies absent, late, leave, and missing punch cases.
- Fix incorrect classifications.
- Test notification messages.
- Deploy the agent only after the results are reliable.

After deployment, the manager should still review important cases before any formal action is taken.

4. Final Result

The result is a Digital FTE for Attendance Monitoring. It works like a digital HR or manager assistant.

It can:

- Check attendance daily.
- Detect late and absent employees.
- Send reminders.
- Escalate repeated issues.
- Prepare daily reports.

- Reduce manual work for the manager.

However, it stays within company rules and keeps humans in control for sensitive decisions.

Final One-Line Summary: The Attendance Monitoring AI Agent is a Digital FTE that checks daily attendance, identifies issues, sends notifications, escalates repeated problems, and helps the manager save time while following company policies and human approval rules.
