

Assignment Requirements Document

Objective

The purpose of this assignment is to help students explore and understand the practical use of AI prompting, iterative development, and Large Language Models (LLMs) through hands-on activities.

Students are expected to complete all the tasks listed below and submit the required deliverables on the Panaversity portal/dashboard.

Tasks

Task 1 — Lab Document Practice & Prompting Report

Lab Document

PDF Link: <https://github.com/panaversity/agentfactory-labs/blob/main/AI-101/ai-prompting-in-2026/ai-prompting-lab.pdf>

Requirements

- Read the lab document shared with you carefully.
- Try and execute all the examples provided in the lab.
- Experiment with prompts and observe how changing prompts affects the outputs.

Deliverable

Create a report document explaining:

- What you learned from the lab
 - How your prompting improved during the process
 - Which prompting techniques or approaches helped you the most
 - Challenges you faced and how you solved them
-

Task 2 — AI Generated Snake Game

Requirements

Create a Snake Game using any AI tool such as:

- ChatGPT

- Gemini Studio (“Create Apps” option)
- Any other LLM or AI coding platform

There are no restrictions on:

- Design
- Features
- Game mechanics
- Technology stack

Students are encouraged to:

- Experiment freely
- Improve the game iteratively
- Add their own creativity and features

Suggested Workflow

1. Give the AI a prompt describing your game idea
2. Generate the initial version
3. Test the game
4. Improve the prompts
5. Keep iterating until the final version is complete

Deliverables

Students must submit:

- Deployed Game/Application Link
- A document/report explaining:
 - Prompt iterations used during development
 - What worked well
 - What did not work
 - How prompts were improved over time
 - Challenges faced during the process

Task 3 — Lecture Slide Generation Using LLMs

Requirements

Our Orientation Lecture is available on YouTube.

Students must:

1. Provide the lecture video to any LLM
2. Use the LLM to understand the lecture content
3. Generate presentation slides covering the lecture topics

Deliverables

Students must submit:

- Generated Slides/Presentation
 - A report/document explaining:
 - What prompts were used
 - Which prompts worked effectively
 - Which prompts did not work well
 - How the prompts were refined
 - The complete process followed to achieve the final result
 - Which AI tools/models were used
-

Final Submission Requirements

Students must submit:

1. Reports/Documents

All reports should clearly explain:

- Learnings from the tasks
- Prompt engineering techniques used
- Iteration and experimentation process
- Problems faced and solutions applied
- What improved the final outputs

2. Task Links/Documents

Submit all relevant:

- Game links
 - GitHub links
 - Google Docs/Slides links
 - PDFs or documents
 - Any additional supporting material
-

Submission Instructions

- Upload all deliverables to your Panaversity Dashboard/Portal.
- Ensure all links are accessible before submission.
- Organize your files properly for easy review.

Evaluation Criteria

Students will be evaluated based on:

- Understanding of prompting concepts
- Creativity and experimentation
- Iterative improvement process
- Quality of documentation
- Completeness of submissions
- Problem-solving approach
- Practical understanding of AI-assisted development
